

# High Speed Ultrasound Beamforming Source Driver

## Features

- ▶ High resolution transmitting waveform
- ▶ Up to 3.0A push-pull source-driving current
- ▶ 160MHz maximum, 3ns time resolution
- ▶ 250Vp-p maximum output, use two DN2625 MOSFETs
- ▶ Angle vector beamforming I-Q switcher matrix
- ▶ 8-bit apodization DAC and 7.5° angular resolution
- ▶ Flexible frequency-resolution trade-off
- ▶ Programmable aperture windowing
- ▶ PWM modulation push-pull current source
- ▶ Focusing phase adjustment & chirp waveform
- ▶ Per-scan-line updating with SPI compatible interface
- ▶ 1.8 to 3.3V CMOS logic interface
- ▶ +5.0V single power supply
- ▶ Low second order harmonic distortions

## Applications

- ▶ Medical imaging ultrasound beamforming transmitter
- ▶ High resolution NDT and Sonar phase array driver
- ▶ Ultrasonic phase array focusing transmitter
- ▶ Piezoelectric & MEMS transducer waveform drivers
- ▶ High speed arbitrary waveform generator

## General Description

MD2130 is a high-speed arbitrary waveform push-pull source-driver. It is designed for medical ultrasound imaging and HIFU beamforming applications.

The IC consists of CMOS digital logic input circuits, an 8-bit current DAC for the waveform amplitude control and four PWM current-sources. These current sources are constructed with a high-speed in-phase and quadrature current-switch matrix and the built-in sine and cosine angle-to-vector look-up table. The angular resolution of the vector table is 7.5° per step with total range of 48 steps. There are four logic input signals to control the in-phase and quadrature PWM push-pull current-source's output timing, frequency, cycle in the burst and waveform envelope.

MD2130's output stage is designed to drive two depletion mode high-voltage DN2625 N-type MOSFETs as the source-driver. The MOSFET drains are connected to a center-tap ultrasound frequency pulse transformer. The secondary winding of the transformer can connect to the ultrasound piezo or capacitive transducer via cable and with a good impedance match. MD2130 has the high-speed SPI compatible interface to achieve per-scan-line fast updating the data register for changing the beamforming phase angles and apodization amplitudes.

## Absolute Maximum Ratings

Parameter	Value
V <sub>LL</sub> , Logic supply	-0.5V to +5.0V
V <sub>DD</sub> , Positive supply	-0.5V to +6V
V <sub>PA</sub> , V <sub>PB</sub> Driver outputs	-0.5V to +6V
V <sub>SUB</sub> , Ground	0V
Operating temperature	0°C to +70°C
Storage temperature	-55°C to +150°C
θ <sub>ja</sub> , Package thermal resistance (4"x3", 4-layer 1oz 16-via PCB)	19°C/W

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## In-Phase and Quadrature Output Current Equations

The in-phase and quadrature phase output sinking current magnitudes,  $I_i$  and  $I_q$ , can be calculated by the following equations:

$$I_i = \frac{24 \cdot V_{REF} \cdot DAC \cdot (2^6 - 1) \cdot \cos(\alpha)}{9 \cdot R_{FB}}$$

$$I_q = \frac{24 \cdot V_{REF} \cdot DAC \cdot (2^6 - 1) \cdot \sin(\alpha)}{9 \cdot R_{FB}}$$

Where the  $V_{REF}$  is the voltage reference, DAC is the decimal value of the data in the DAC register,  $R_{FB}$  is the setting resistor value in ohms,  $\alpha$  is the value of the vector angle in degree.

The absolute values of the results from the equations represent the magnitude of the output sinking current. The plus or minus sign of the results indicate the current flow in to the output port PA or PB, respectively. Note that the maximum full scale of pulse current at PA or PB port only can be obtained at DAC = 255,  $V_{REF} = 2.5V$ ,  $R_{FB} = 50k\Omega$ ,  $\alpha = 45^\circ$  and IA = QA = Hi or IB = QB = Hi conditions.
